

## FEATURES

- 9216 pixels per line
- Number of TDI stages electronically selectable: {4, 8, 16, 32, 64, 96, 128}
- Bi-directional TDI (shift up or down)
- 6 outputs — each capable of 20MHz data rate — 160MHz total data rate
- 100% fill factor
- 8.75 $\mu$ m x 8.75 $\mu$ m pixel size
- On-chip binning capability

## GENERAL DESCRIPTION

The CCD8091 is a 9216 pixel x 128 line, high speed TDI sensor. The active imaging area is organized as 9216 vertical columns and 128 horizontal TDI rows. The array is set up for bi-directional operation. There are identical output registers and amplifiers on both the top and the bottom of the array. The outputs to be used (either top or bottom) are user-selectable and controlled by the vertical clock timing. In addition, the exposure level can be controlled by reducing the number of TDI rows from 128 to 96, 64, 32, 16, 8 or 4. This is also user-selectable and is accomplished by supplying the appropriate phasing for the vertical clocks within each section. For instance, if 64 lines of TDI were required, the vertical clocks for lines 65-128 would be connected to a high potential, which would drain these unused rows out to the opposite side (unused) of the array to be dumped into the VOFD drain. With six outputs, each running at 20MHz, the CCD8091 can provide a total data rate of 160MHz enabling the CCD to run at better than 12kHz line rate. Utilizing Fairchild Imaging proprietary buried channel CCD process, the CCD8091 achieves consistent, superior TDI performance.

The active imaging area is separated from the six horizontal output registers by 21 isolation rows. These isolation rows are covered by a metal lightshield to protect them while charge transfers to the output registers. Both the active imaging area and the isolation region utilize 3-phase clocking.

The six horizontal output registers utilize 4-phase clocking. Special design techniques have been implemented to maximize charge transfer efficiency especially at low light levels. The output amplifier is a 3-stage source follower configuration. This allows maximum scale factor (charge to voltage conversion) and maximum bandwidth.

The CCD8091 is housed in a custom 176 pin (100 mil grid) ceramic PGA package. It has an AR coated window.

## FUNCTIONAL DESCRIPTION

The following functional elements are illustrated in the block diagram:

**Image Sensing Elements:** These are elements of a line of 9216 image sensors separated by channel stops and covered by a passivation layer. Incident photons pass through a transparent polycrystalline silicon gate structure creating electron hole pairs. The resulting photoelectrons are collected in the photosites during the integration period. The amount of charge accumulated in each photosite is a linear function of the localized incident illumination intensity and integration period.

**Transfer Gates:** This gate is a structure adjacent to the row of image sensor elements. The charge packets accumulated in the photosites are transferred in parallel via the transfer gate to the transport shift

registers whenever the transfer gate voltage goes high.

**Shift Registers:** The vertical shift register is 3-phase and the horizontal shift register is 4-phase.

**Time Delay and Integration:** This function is accomplished by scanning the image scene across the array at the same rate as the vertical shift register moves the signal charge. This results in an effective increase in the integration time.

**Output Amplifier:** The CCD8091 is designed for either uni-directional or bi-directional operation. There are six identical output registers and amplifiers on both the top and bottom of the array. There are three-stage source follower amplifiers with a reset MOSFET tied to the input gate.

Charge packets are clocked to a pre-charged capacitor whose potential changes linearly in response to the number of electrons delivered. This potential is applied to the input gate of an NMOS amplifier producing a signal at the output  $V_{out}$  pin. The capacitor is reset with  $\phi_R$  to a pre-charge level prior to the arrival of the next charge packet except when horizontally binning. It is reset by use of the reset MOSFET.

The output amplifier drain is tied to VDD. The source is connected to an external load resistor to ground. The source constitutes the video output from the device.

## DEFINITION OF TERMS

**Charge-Coupled Device:** A charge-coupled device is a monolithic silicon structure in which discrete packets of electron charge are transported from position to position by sequential clocking of an array of gates.

**Isolation Rows:** There are 21 isolation rows between the image area and the horizontal shift register. These non-imaging

rows are used as buffer rows to eliminate crosstalk to the horizontal shift register.

**Dynamic Range:** The ratio of saturation output voltage to RMS noise in the dark. The peak-to-peak random noise is 4-6 times the RMS noise output.

**RMS Noise Equivalent Exposure:** The exposure level that gives an output signal equal to the RMS noise level at the output in the dark.

**Saturation Exposure:** The minimum exposure level that produces an output signal corresponding to the maximum photosite charge capacity. Exposure is equal to the product of light intensity and integration time.

**Charge Transfer Efficiency:** Percentage of valid charge information that is transferred between each successive stage of the transport register.

**Responsivity:** The output signal voltage per unit of exposure.

**Photo-Response Non-Uniformity:** The difference of the response levels between the most and the least sensitive regions under uniform illumination (excluding blemished elements) expressed as a percentage of the average response.

**Dark Signal:** The output signal caused by thermally generated electrons. Dark signal is a linear function of integration time and an exponential function of chip temperature.

**Integration Time:** The time interval between the falling edges of any two successive transfer pulses is the integration time shown in the timing diagram. The integration time is the time allowed for the photosites to collect charge.

**Pixel:** Picture element or sensor element, also called photoelement or photosite.

**Block Diagram: TDI Transfer Up**

No. of TDI pixel rows is selected by clock timing: {4, 8, 16, 32, 64, 96, 128}

**Block Diagram: TDI Transfer Down**

No. of TDI pixel rows is selected by clock timing: {4, 8, 16, 32, 64, 96, 128}

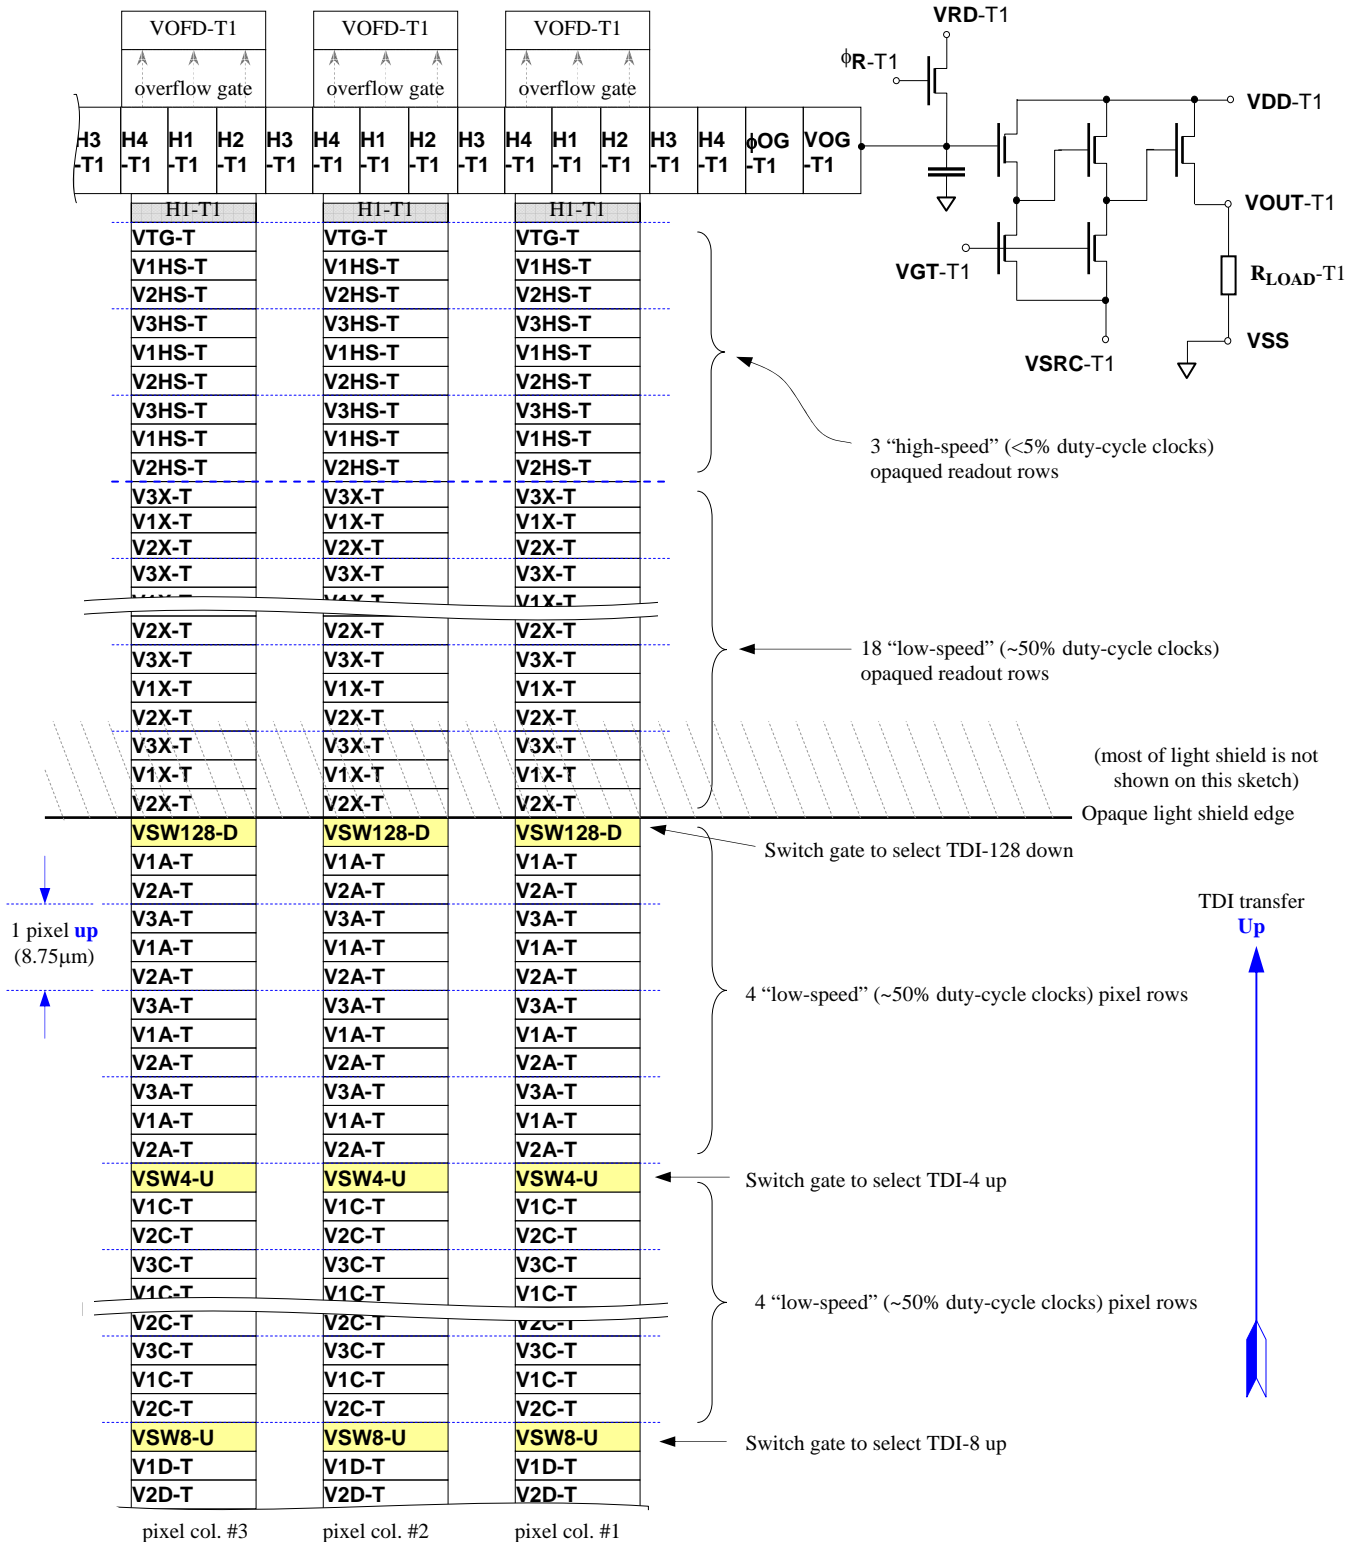

**Block Diagram of Sector “x”** (where  $x=\{1, 2, \dots, 8\}$  for CCD10121,  $x=\{1, 2, \dots, 6\}$  for CCD8091,  $x=\{1, 2, \dots, 4\}$  for CCD5061.)

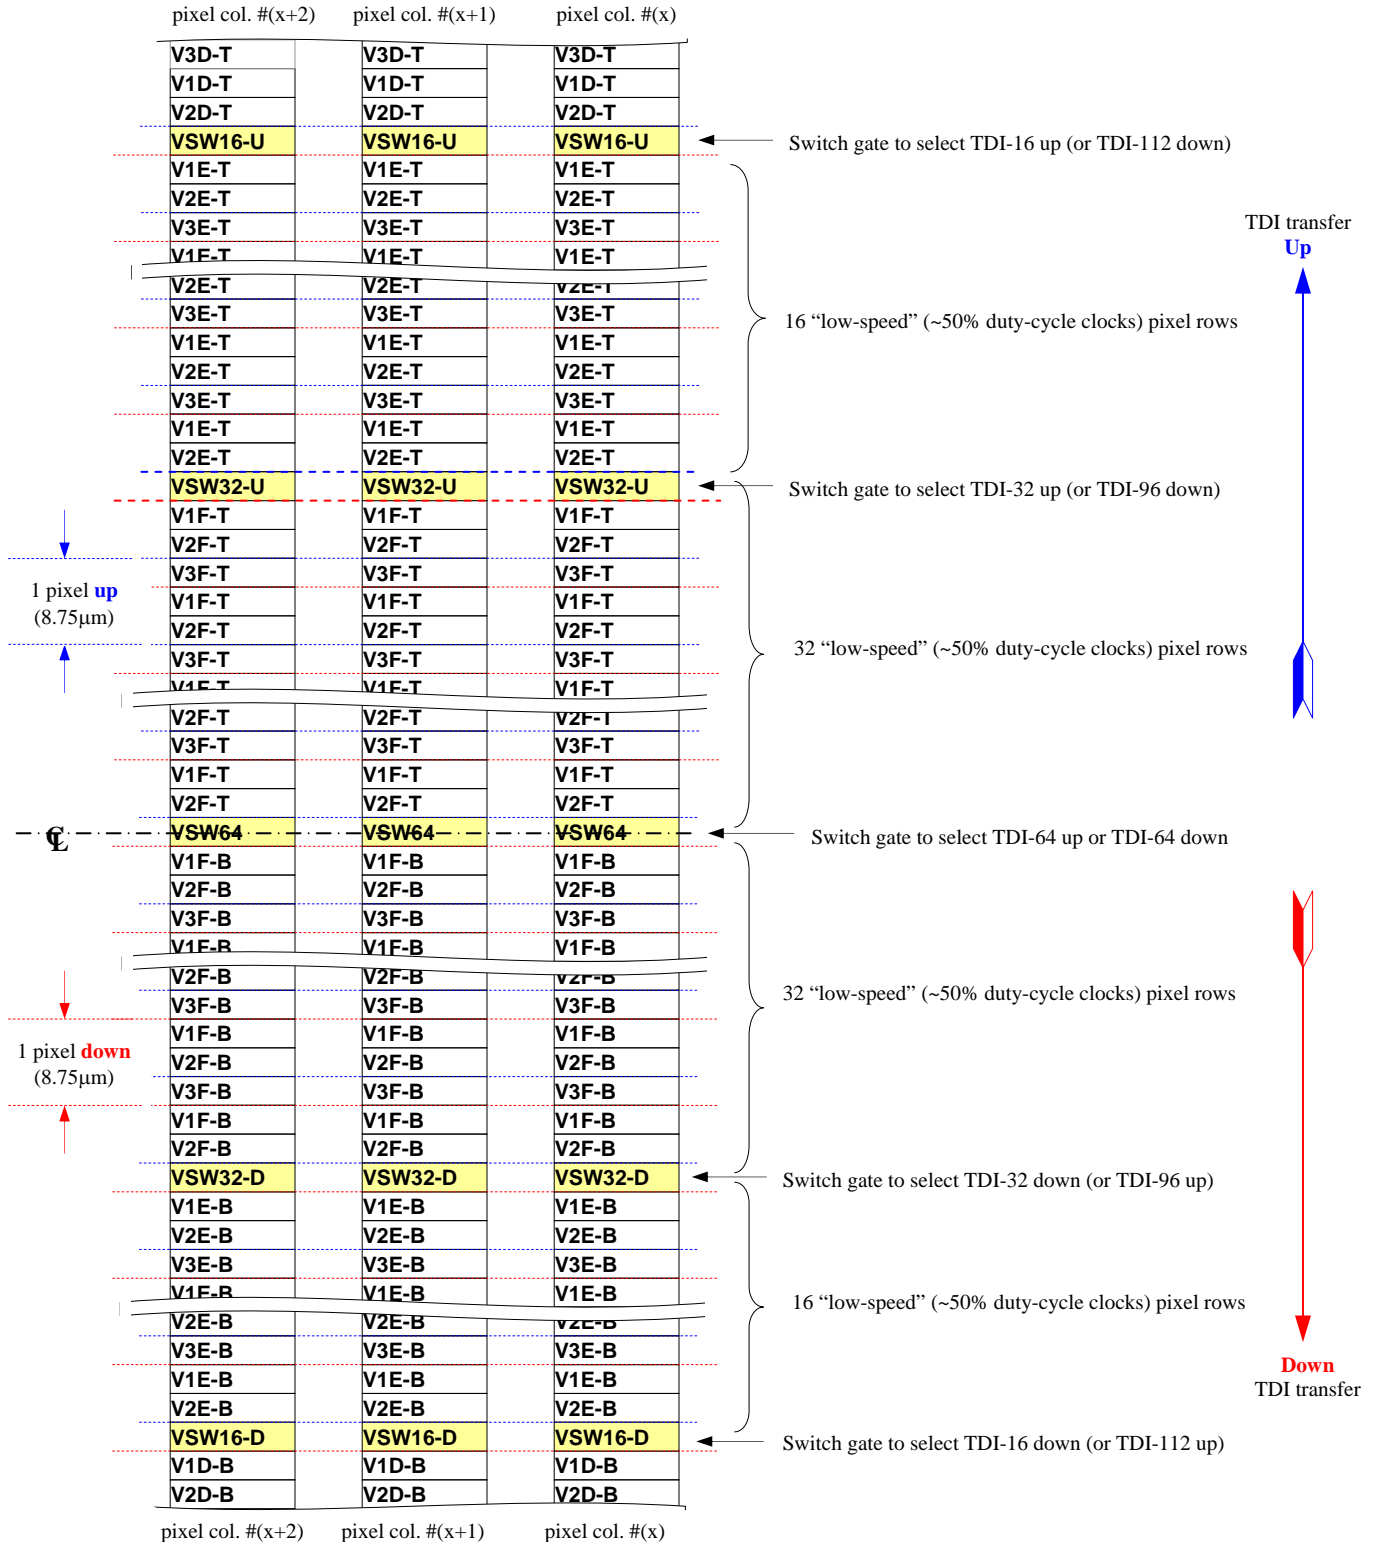

### Block Diagram at Sector T1 Output Amplifier

(All top sectors T1, T2, ...T8 have this design.)

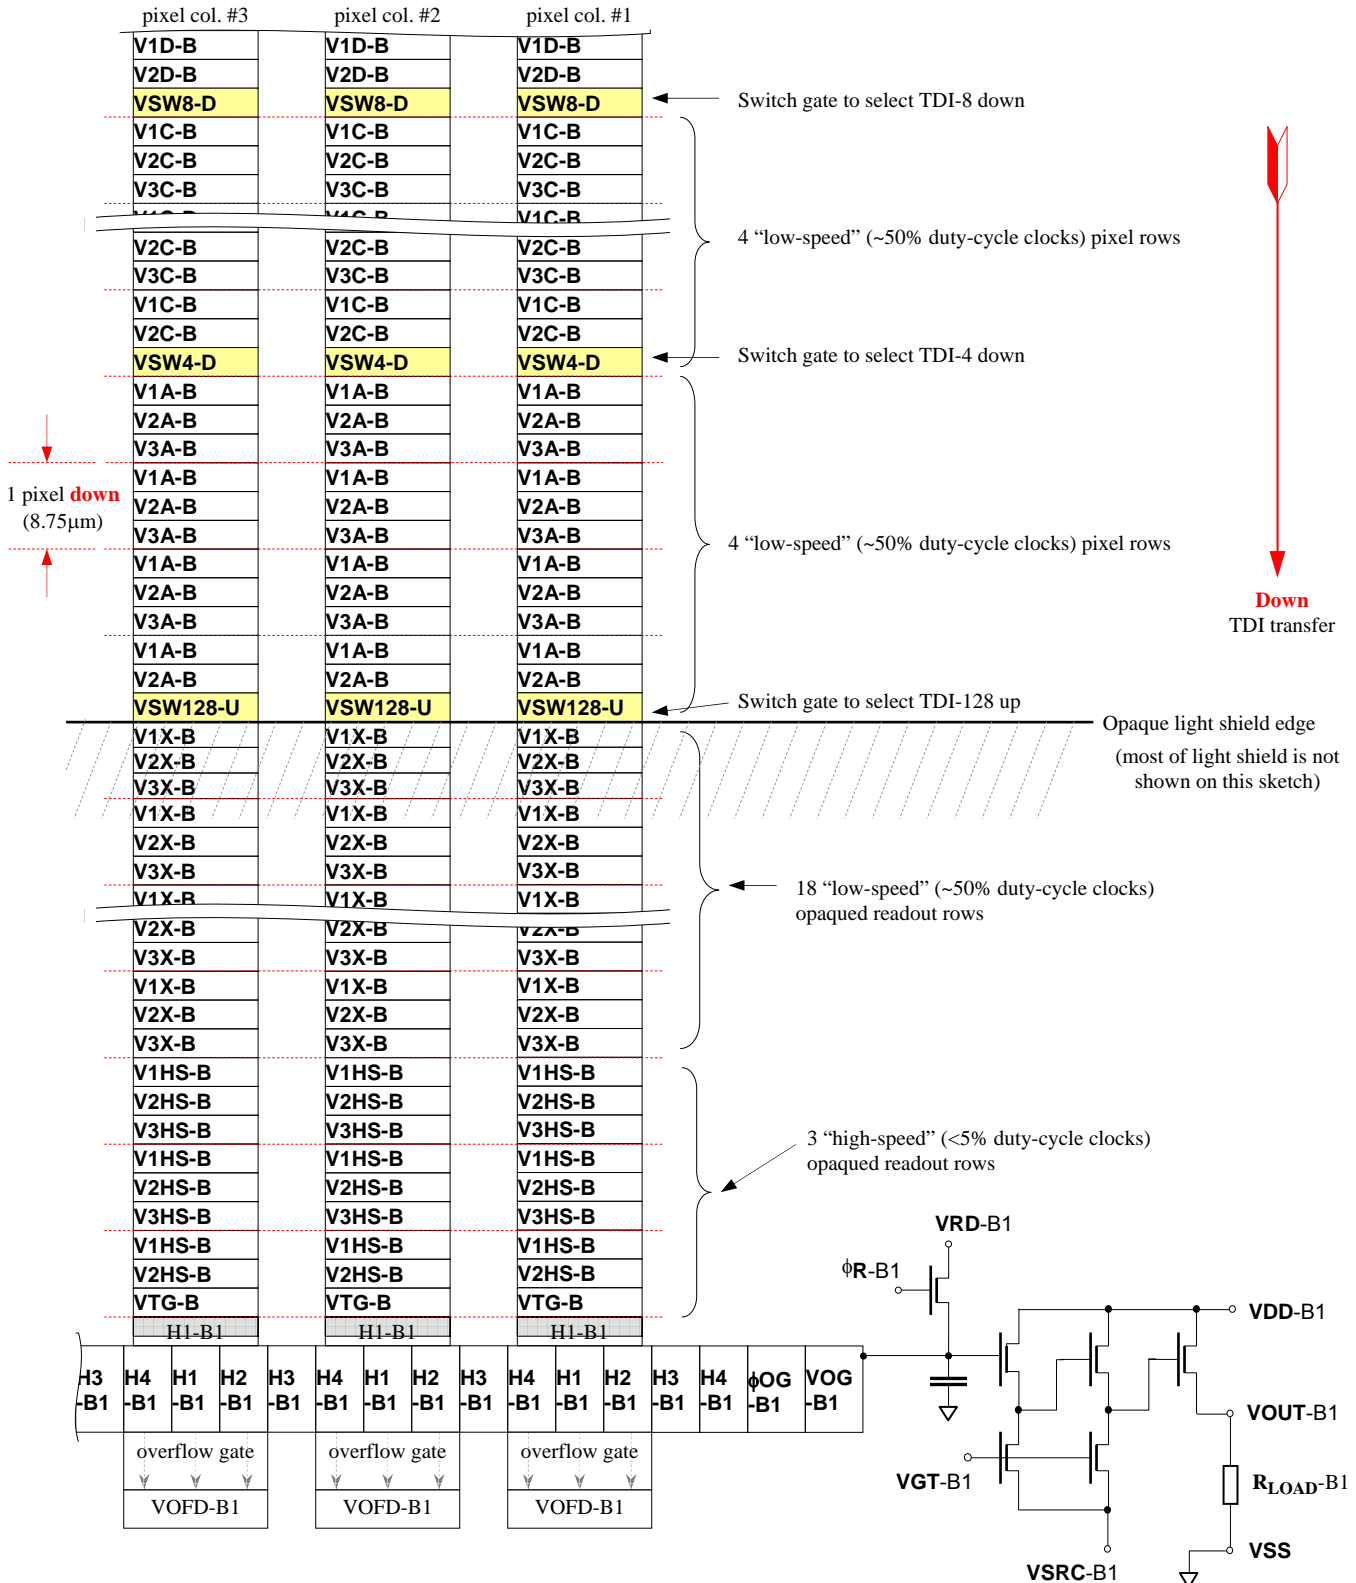

### Block Diagram at Pixel Array Vertical Centerline

### Block Diagram at Sector B1 Output Amplifier

(All bottom sectors B1, B2,...B8 have this design.)

CCD8091 Device Architecture	
Pixel array (across-the-TDI-scan)	9216 pixels per line = 8 sectors x 1,536 pixels/sector
Pixel array (along-the-TDI-scan)	Clock-selectable: {4, 8, 16, 32, 64, 96, or 128} pixels / TDI column
TDI transfer direction	Bi-directional (“up” or “down”)
Pixel size	8.75µm x 8.75µm
Image format	80.64mm x 1.12mm
Number of output ports	6 @ Top (transfer “up”), 6 @ Bottom (transfer “down”)
Pixel rate / output (max)	20M pixel/s / output
Total pixel output rate (max)	120M pixel/s = 20M pixel/s/output x 6 outputs
Vertical (“parallel”) shift registers	3-phase
Number of isolation rows	21 top, 21 bottom (all covered by opaque light shield)
Horizontal (“serial”) shift registers	4-phase

CCD8091 Performance Specifications					
Symbol	Parameter	Min.	Typ.	Max.	Units / Remarks
Q <sub>SAT</sub>	Saturation Charge (“Full Well”)	350	450		ke- at 12k lines/s
CG	Conversion Gain	2.5	3.3	4.0	µV/e-
V <sub>SAT</sub>	Saturation Voltage		1.5		V
VLIN	Non-Linearity		1%	5%	@ 10% to 90% Full Well
DR	Dynamic Range		10,000		DR = Q <sub>SAT</sub> / NE
H-CTE	Horizontal CTE	0.999985	0.999995		/transfer (4 H-transfers/pixel)
V-CTE	Vertical CTE	0.999980	0.999995		/transfer (3 V-transfers/pixel)
NE	Read Noise		40	50	e-rms
PRNU	Photoresponse Non-Uniformity		5	20	% pk-pk
F <sub>PIXEL</sub>	Pixel Array Flatness		30		µm pk-pk (note 1)
DS	Dark Signal		1.3	6	nA/cm <sup>2</sup> at +25°C
-----	DC offset on VOUT pins		15		V
P <sub>AMPS</sub>	Power dissipation: output amps		0.7		W (note 2)
P <sub>H-CLK</sub>	Power dissipation: H-clocks		1.1		W (note 3)
P <sub>V-CLK</sub>	Power dissipation: V-clocks		0.1		W (note 3)

Note 1: Measured to the best-fit plane to the pixel array. F<sub>PIXEL</sub> < 13µm pk-pk is available on special order.  
 Note 2: Power dissipated in R<sub>LOAD</sub> resistors (which are not inside the CCD package) is not included in this total.  
 Note 3: Clock power dissipation is proportional to C\*V<sup>2</sup>\*f

**TEST CONDITIONS:** All testing performed at:

- Temp = +25°C typ.
- Horizontal clock frequency = 20MHz / output
- Vertical clock frequency = 12kHz
- Input voltages and load resistors R<sub>LOAD</sub> at typical values, except (a) horizontal register clock offsets may be tuned as required to optimize performance, and (b) {H1, H2, H3, & H4} clock swings ≤6Vpp.
- Q<sub>SAT</sub> and V<sub>SAT</sub> measured in TDI-128-up and TDI-128-down modes. FF (Full-frame) mode may be used as convenient to measure other parameters.
- No binning: 1x1 full-resolution mode.

Typical QE Curve for CCD8091

Output Amplifier Voltages & External Load Resistor						
Symbol	Parameter	Min	Typ	Max	Unit	Remarks
VDD	Amplifier DC Supply		+23		V	$I_{DD} \cong +15\text{mA} / \text{pin}$ . See note 1
VRD	Reset Drain		+16		V	See note 1
VOFD	Overflow Drain		+16		V	See note 2
VSRC	Current source ("signal ground") from amplifier 1 <sup>st</sup> & 2 <sup>nd</sup> stages		+2.5		V	$I_{SRC} \cong -1.5\text{mA} / \text{pin}$
VGT	Bias voltage for amplifier 1 <sup>st</sup> & 2 <sup>nd</sup> -stage constant-current-source FETs		+4		V	$I_{GT} < 1\text{nA} / \text{pin}$
VOG	Output Gate DC Bias		-4		V	$I_{OG} < 1\text{nA} / \text{pin}$
VSS	Substrate [Ground]		0		V	
R <sub>LOAD</sub>	Output Load on each VOUT pin to VSS	0.9	1.0		k $\Omega$	If the external preamp has <100k $\Omega$ equivalent input resistance, then increase R <sub>LOAD</sub> so that the total equivalent resistance from VOUT to VSS is 1.0k $\Omega$

Note 1: Whenever  $VDD > +12\text{V}$ , VRD must be biased at not less than 12V less than VDD:

$$VRD \geq (VDD - 12\text{V}), \text{ for all } VDD > +12\text{V}$$

A zener diode circuit is recommended to ensure that this condition is always met. If this condition is not met, even momentarily, then permanent damage to the output amplifier(s) may result.

Note 2:  $(VRD - 2\text{V}) < VOVD < (VRD + 2\text{V})$  If this condition is not met, even momentarily (for example, during power-up or power-down), then permanent damage to the CCD gates may result.

Absolute Maximum Ratings				
Pin Names (suffixes not listed below)	Min	Max	Unit	Remarks
VSS	0	0	V	Must be grounded to 0V when device is being handled. Do not "float".
VDD, VRD, VOVD, VOUT, VSRC, VGT	-0.4	+25	V	Each pin has a diode to VSS on the chip
All other pins	-5	+20	V	
$\Delta$ Voltage between adjacent CCD gates	-24	+24	V	Block diagram shows adjacent gates.
Storage temperature	-40	+70	$^{\circ}\text{C}$	
Operating temperature	-40	+60	$^{\circ}\text{C}$	

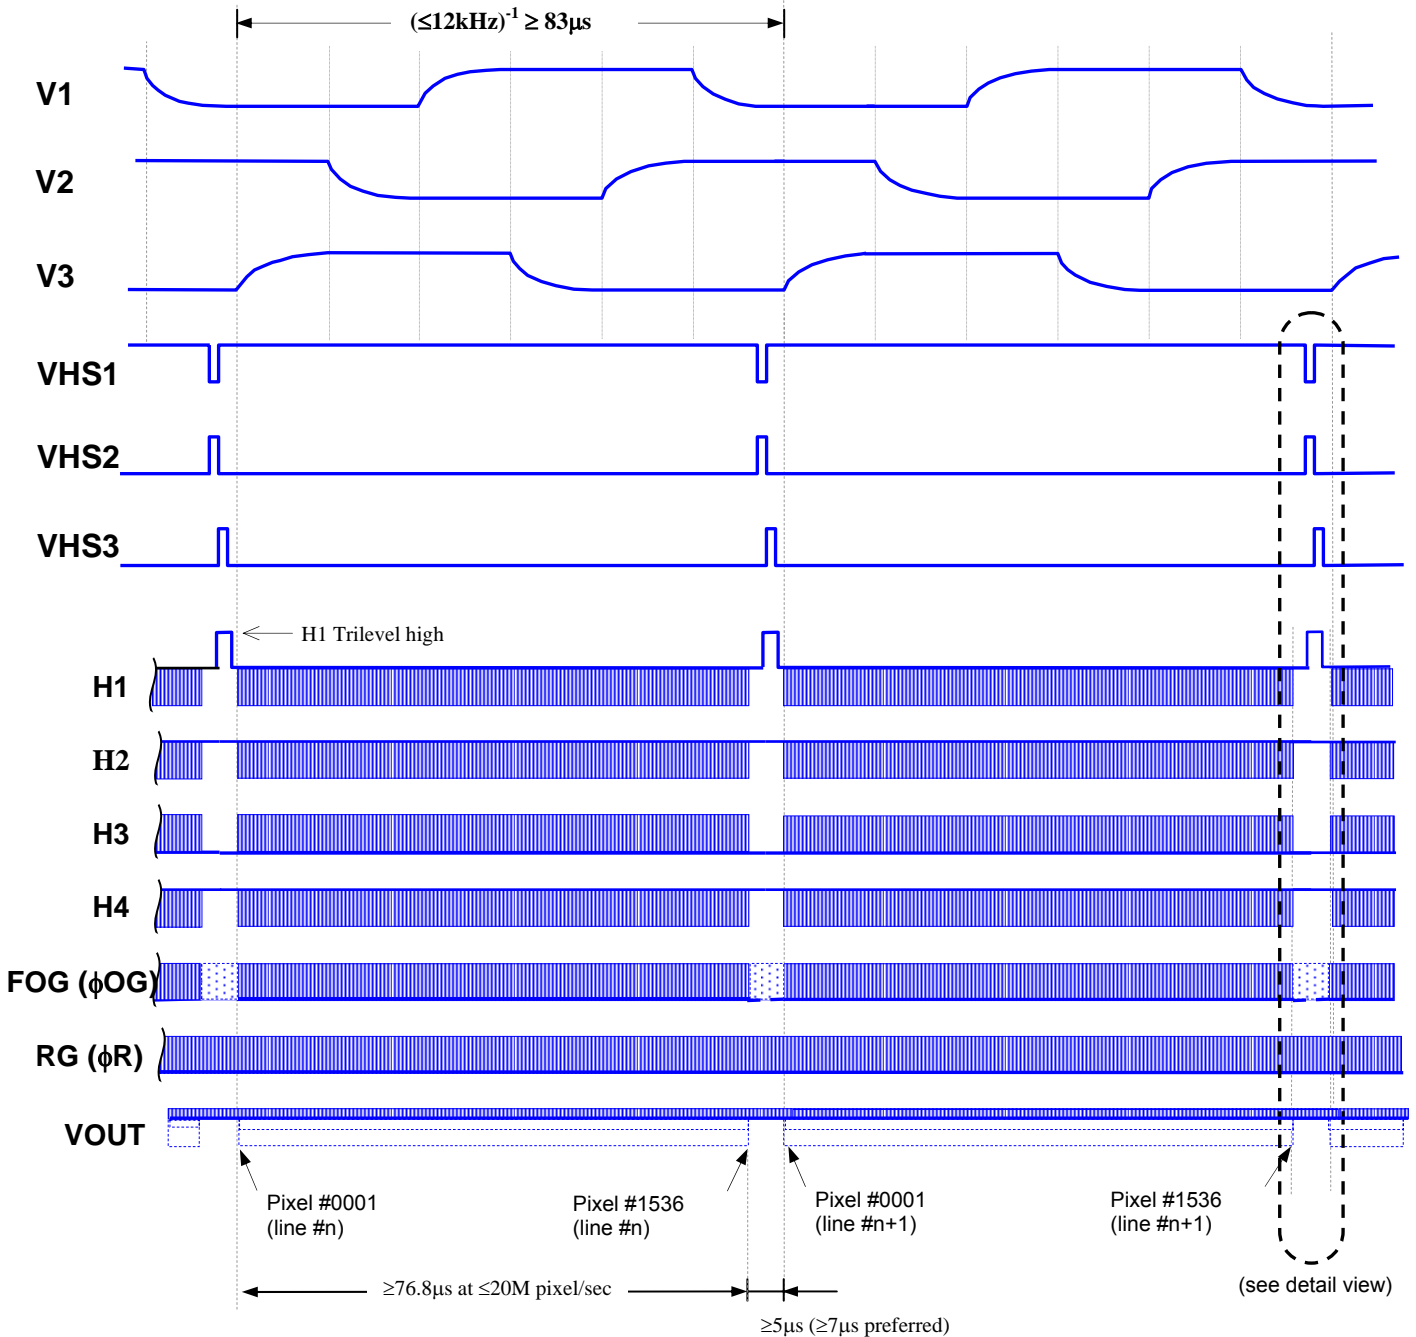

Clock Voltages						
Name	Parameter	Min	Typ	Max	Unit	Remarks
V1, V2	"Slow" (~50% duty cycle) vertical shift register clocks					
	Clock-High		+18		V	Readout side
	Clock-Low		0		V	Readout side
	V-dump		+15		V	Dump side
V3	"Slow" (~50% duty cycle) vertical shift register clock					
	Clock-High		+18		V	Readout side
	Clock-Low		0		V	Readout side
	V-dump		+15		V	Dump side
	V-off		-3		V	For VSWxx TDI-length-control gate at the selected readout/dump boundary
V1-HS, V2-HS, V3-HS	"Fast" (<5% duty cycle) vertical shift register clocks (3 isolation rows nearest Horizontal shift registers)					
	Clock-High		+15		V	Readout side
	Clock-Low		0		V	Readout side
	V-dump		+15		V	Dump side
H1	Horizontal shift register clock, and Vertical→Horizontal transfer clock					
	Trilevel		+5		V	Only during V→H transfer
	Clock-High		0		V	Note 1
	Clock-Low		-5		V	Note 1
	H-dump		+3		V	Dump side
H2, H3, H4	Horizontal shift register clocks					
	Clock-High		0		V	Note 1
	Clock-Low		-5		V	Note 1
	H-dump		+3		V	Dump side
φOG (FOG)	Clocking output gate					
	Clock-High		+1		V	Note 1
	Clock-Low		-5		V	Note 1
	H-dump		+3		V	Dump side (or set to φOG clock-high)
φR (RG)	Reset gate clock					
	Clock-High		+15		V	
	Clock-Low		+4		V	
	H-dump		+3		V	Dump side (or set to φR clock-high)

Note 1: May require individually tuned voltages for optimum performance, especially at high speed.

CCD8091 Clock Capacitance						
Symbol	Parameter	Min	Typ	Max	Unit	Remarks
Photosite rows: V1, V2, V3: capacitance per pixel row						
	V1 to VSS		16		pF	
	V1 to V2		19		pF	
	V1 to V3		18		pF	
	V2 to VSS		24		pF	
	V2 to V3		22		pF	
	V3 to VSS		22		pF	
Isolation and high-speed rows: capacitance per row						
	V1 to VSS		20		pF	
	V1 to V2		19		pF	
	V1 to V3		18		pF	
	V2 to VSS		30		pF	
	V2 to V1 (see above)					
	V2 to V3		22		pF	
	V3 to VSS		31		pF	
	V3 to V1 (see above)					
	V3 to V2 (see above)					
Horizontal transport gate and reset gate capacitance per 1536-element output section						
	H1		90	110	pF	
	H2		90	110	pF	
	H3		90	110	pF	
	H4		110	130	pF	
	ΦOG			10	pF	
	ΦR			10	pF	

Total for each H-clock includes ~50pF gate-to-gate capacitance, mostly to the nearest neighboring H-gates. For example, H1 has ~67pF H1-VSS, ~20pF H1-H2, ~30pF H1-H4, and ~3pF H1-H3.

### Clock Timing Overview (1x1 full-resolution mode)

**Vertical-to-Horizontal Clock Timing (1x1 full-resolution mode)**

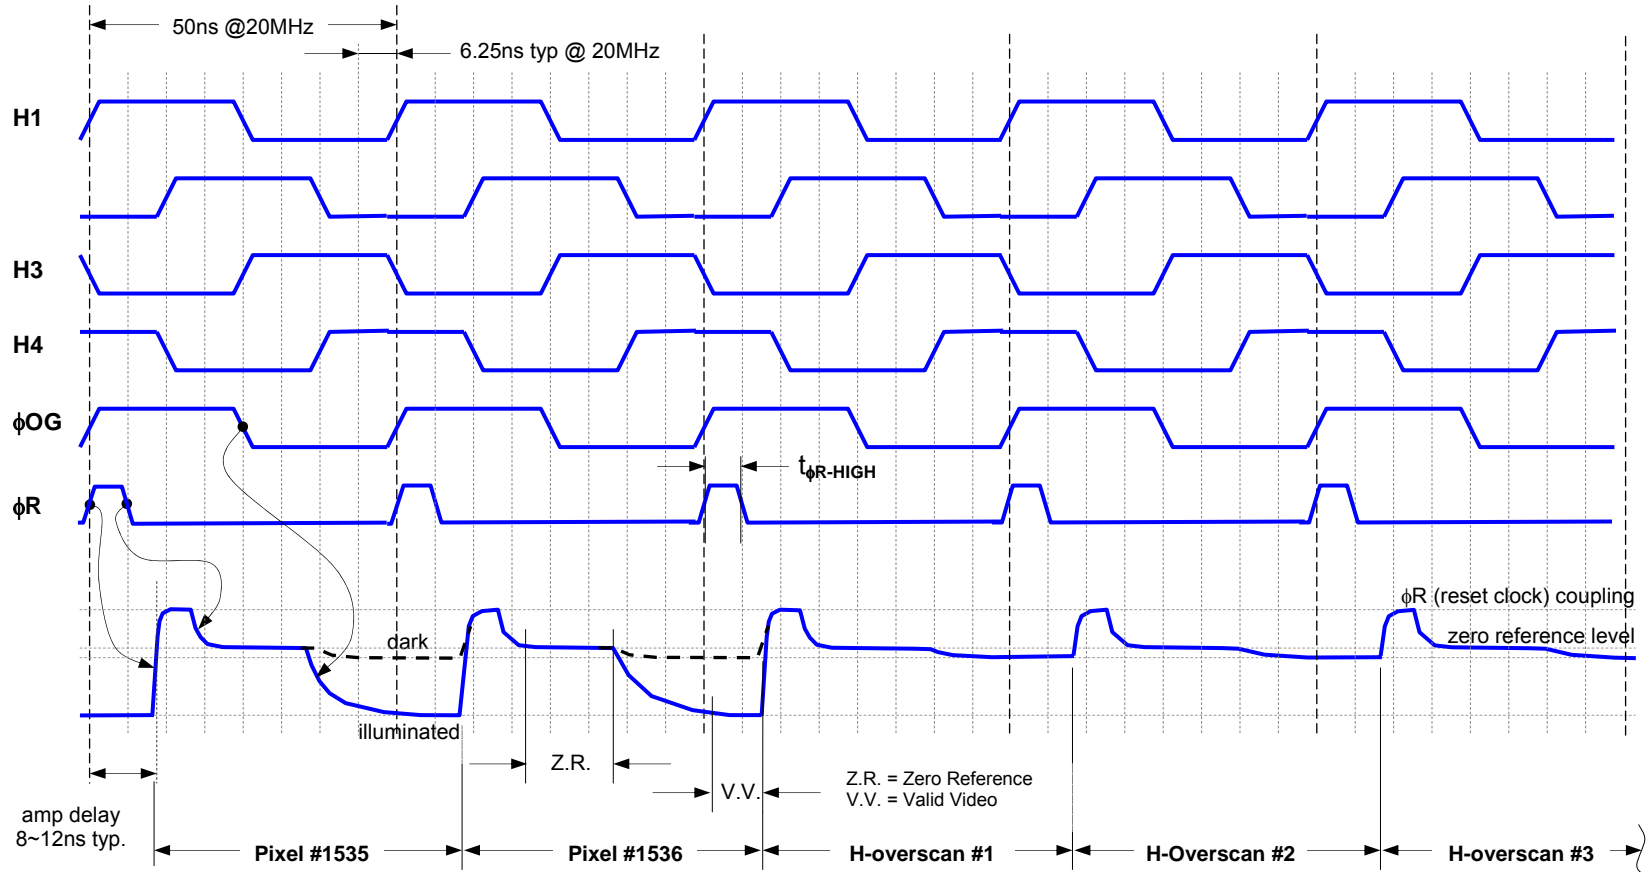

**Clock Timing** (parameters not otherwise specified on timing diagrams)

Clock	Parameter(s)	Min	Typ	Max	unit	Notes
V1, V2	$t_{RISE}(0\% \rightarrow 90\%), t_{FALL}(100\% \rightarrow 10\%)$		4		$\mu\text{s}$	(1)
V3	$t_{RISE}(0\% \rightarrow 90\%), t_{FALL}(100\% \rightarrow 10\%)$		7		$\mu\text{s}$	(1)
VHS1, VHS2, VH3	$t_{RISE}(0\% \rightarrow 90\%), t_{FALL}(100\% \rightarrow 10\%)$		0.3		$\mu\text{s}$	
H1, H2, H3, H4	$t_{RISE}(0\% \rightarrow 90\%), t_{FALL}(100\% \rightarrow 10\%)$		2		ns	
H1	$t_{TRILEVEL}$		0.3		$\mu\text{s}$	
$\phi_{OG}$ (FOG)	$t_{RISE}(0\% \rightarrow 90\%), t_{FALL}(100\% \rightarrow 10\%)$		2		ns	
$\phi_R$ (RG)	$t_{RISE}(0\% \rightarrow 90\%), t_{FALL}(100\% \rightarrow 10\%)$		1		ns	
$\phi_R$ (RG)	$t_{\phi_R-HIGH}$		4		ns	

(1) Use typical values to maximize QSAT at LineRate=12,000 pixel\_lines/s.

#### 4-phase Horizontal Clock Timing (1x1 full-resolution mode)

For best results, especially at high speed (20MHz), use:

- {H1, H2, H3, H4,  $\phi_{OG}$ } duty cycle = 50%
- H1 falling edge is at same time as H3 rising edge, H1 rising edge is same time as H3 falling edge → H1 clock glitches cancel H3 clock glitches.
- H2 falling edge is at same time as H4 rising edge, H2 rising edge is same time as H4 falling edge → H2 clock glitches cancel H4 clock glitches.
- H1 and  $\phi_{OG}$  have identical clock timing (although H1 clock voltage may not be same as  $\phi_{OG}$  clock voltage).

Pin Name and Description		
Pin Name	Signal Description	Remarks
VTG-T	Vertical-to-horizontal transfer gate – top	
V1HS-T, V2HS-T, V3HS-T	Fast (<5% duty cycle) vertical shift register gates – top 3 opaqued rows	
V1X-T, V2X-T, V3X-T	Slow (~50% duty cycle) vertical shift register gates – next 18 opaqued top rows	(1)
VSW128-D	Slow (~50% duty cycle) vertical shift register V3 gate – top pixel row #1	(1), Connect to V-OFF for TDI-128-down
V1A-T, V2A-T, V3A-T	Slow (~50% duty cycle) vertical shift register gates – top pixel rows #1~#4	(1)
VSW4-U	Slow (~50% duty cycle) vertical shift register V3 gate – top pixel row #4	(1), Connect to V-OFF for TDI-4-up
V1C-T, V2C-T, V3C-T	Slow (~50% duty cycle) vertical shift register gates – top pixel rows #5~#8	(1)
VSW8-U	Slow (~50% duty cycle) vertical shift register V3 gate – top pixel row #8	(1), Connect to V-OFF for TDI-8-up
V1D-T, V2D-T, V3D-T	Slow (~50% duty cycle) vertical shift register gates – top pixel rows #9~#16	(1)
VSW16-U	Slow (~50% duty cycle) vertical shift register V3 gate – top pixel row #16	(1), Connect to V-OFF for TDI-16-up
V1E-T, V2E-T, V3E-T	Slow (~50% duty cycle) vertical shift register gates – top pixel rows #17~#32	(1)
VSW32-U	Slow (~50% duty cycle) vertical shift register V3 gate – top pixel row #32	(1), Connect to V-OFF for TDI-32-up, Connect to V-OFF for TDI-96-down
V1F-T, V2F-T, V3F-T	Slow (~50% duty cycle) vertical shift register gates – top pixel rows #33~#64	(1)
VSW64-U	Slow (~50% duty cycle) vertical shift register V3 gate – top pixel row #64	(1), Connect to V-OFF for TDI-64-up, Connect to V-OFF for TDI-64-down
V1F-B, V2F-B, V3F-B	Slow (~50% duty cycle) vertical shift register gates – bottom pixel rows #33~#64	(1)
VSW32-D	Slow (~50% duty cycle) vertical shift register V3 gate – bottom pixel row #32	(1) Connect to V-OFF for TDI-32-down, Connect to V-OFF for TDI-96-up
V1E-B, V2E-B, V3E-B	Slow (~50% duty cycle) vertical shift register gates – bottom pixel rows #17~#32	(1)
VSW16-D	Slow (~50% duty cycle) vertical shift register V3 gate – bottom pixel row #16	(1), Connect to V-OFF for TDI-16- down
V1D-B, V2D-B, V3D-B	Slow (~50% duty cycle) vertical shift register gates – bottom pixel rows #9~#16	(1)
VSW8-D	Slow (~50% duty cycle) vertical shift register V3 gate – bottom pixel row #8	(1), Connect to V-OFF for TDI-8- down
V1C-B, V2C-B, V3C-B	Slow (~50% duty cycle) vertical shift register gates – bottom pixel rows #5~#8	(1)
VSW4-D	Slow (~50% duty cycle) vertical shift register V3 gate – bottom pixel row #4	(1), Connect to V-OFF for TDI-4- down
V1A-B, V2A-B, V3A-B	Slow (~50% duty cycle) vertical shift register gates – bottom pixel rows #1~#4	(1)
VSW128-U	Slow (~50% duty cycle) vertical shift register V3 gate – bottom pixel row #1	(1), Connect to V-OFF for TDI-128-up
V1X-B, V2X-B, V3X-B	Slow (~50% duty cycle) vertical shift register gates – next 18 opaqued bottom rows	(1)
V1HS-B, V2HS-B, V3HS-B	Fast (<5% duty cycle) vertical shift register gates – bottom 3 opaqued rows	

Pin Name and Description		
Pin Name	Signal Description	Remarks
VTG-B	Vertical-to-horizontal transfer gate – bottom	
H1-Tx, H2-Tx, H3-Tx, H4-Tx	4-phase horizontal shift register gates, top sector Tx	(2)
H1-Bx, H2-Bx, H3-Bx, H4-Bx	4-phase horizontal shift register gates, bottom sector Bx	(2)
FOG-yx ( $\phi$ OG-yx)	Horizontal shift register summing gate, sector yx	(2), (3)
RG-yx ( $\phi$ R-yx)	Reset gate, sector yx	(2), (3)
VDD-yx	Amplifier power supply, sector yx	(2), (3)
VRD-yx	Reset drain, sector yx	(2), (3)
VOFD-yx	Overflow drain, sector yx	(2), (3)
VSRC-yx	Amplifier 1 <sup>st</sup> -stage and 2 <sup>nd</sup> -stage load source (sinks ~1.25mA / pin), sector yx	(2), (3)
VGT-yx	Amplifier 1 <sup>st</sup> -stage and 2 <sup>nd</sup> -stage load current control (gate bias), sector yx	(2), (3)
VSS	Substrate (ground)	Connect all VSS pins to 0V
TEMP-yx	<i>(optional; not installed on standard devices)</i> 100k $\Omega$ thermistor temp sensor	

- (1) All slow vertical shift register gates have identically-named pins at both ends of the CCD package. For each of these gates, connect both ends to the clock driver. Do not drive from one end only; this will reduce QSAT at high line rates.
- (2) x = sector number: CCD10121: x={1, 2, 3, ...8}; CCD8091: x={1, 2, 3, ...6}; CCD5061: x={1, 2, 3, 4}.
- (3) y = TDI transfer direction: y={T, B} for Top (transfer up) or Bottom (transfer down).

Note 1: Connect to H-dump, or hold at RG ( $\phi_R$ ) clock-high, or clock with RG ( $\phi_R$ ).

Note 2: Connect to H-dump, or hold at FOG ( $\phi_{OG}$ ) clock-high, or clock with FOG ( $\phi_{OG}$ ).

Note 3:  $x = \{1, 2, \dots, 8\}$  for CCD10121;  $\{1, 2, \dots, 6\}$  for CCD8091,  $\{1, 2, \dots, 4\}$  for CCD5061.

Note 4: VDD connections on dump side: If the CCD10121 (or CCD8091 or CCD5061) always transfers only in one direction (either up or down), then to minimize power dissipation (a) connect dump side VDD pins to VSRC, and (b) do not install dump side  $R_{LOAD}$  resistors. If the CCD10121/CCD8091/CCD5061 is used alternately up and down, then connect “dump” side VDD pins to VDD to avoid power-up / power-down  $R \cdot C$  time constant problems, or power down dump side VDD to approximately +10VDC.

### CCD HANDLING PRECAUTIONS TO PREVENT ESD DAMAGE

By their very nature, CCDs are very sensitive to electro-static discharge (ESD) damage. Special ESD-control equipment and personnel training are mandatory, particularly when installing or removing the CCD from a camera system. See Fairchild Imaging application note “Prevention of ESD Damage in CCD Image Sensors” for details. Key points:

- Use ESD-safe workbench surfaces. Cover metallic workbench surfaces with ESD-safe grounded mats. Remove non-ESD-safe materials (paper, tools with plastic handles, etc.) from work area.
- Use wrist straps or equivalent (~1M $\Omega$  to ground), ESD-safe lab coat or equivalent (buttoned—not open), and ESD-safe gloves or finger cots. Test wrist strap before handling CCDs.
- Relative humidity must be 40% min.; >50% recommended.
- Use ionizing air blowers; type: AC (not pulsed DC), balance  $\leq |\pm 20V|$  max.,  $\leq |\pm 10V|$  recommended. Performance spec at work area: voltage decay from 1000V to 100V in <10 seconds. Measure this periodically; air ionizers require maintenance.
- Allow devices to slowly discharge in the ionized air stream when removing devices from their 1st-level container, and when removing devices from test sockets.
- The receiving socket and associated circuitry must be adequately grounded.
- Store CCDs with all pins shorted together by shorting bars, conductive foam, or the equivalent.

ESD damage invalidates the warranty.

## Package Diagram

### COSMETIC GRADING

Device grading helps to establish a ranking for the image quality that a CCD will provide. Blemishes are characterized as spurious pixels exceeding 10% of  $V_{SAT}$  with respect to neighboring elements. Blemish content is determined in the dark, at various illumination levels and at different operating temperatures.

### WARRANTY

Fairchild Imaging warrants that its products will be free of defects in material and workmanship under normal use and service for one year from date of shipment.

### CERTIFICATION

Fairchild Imaging certifies that all products are carefully inspected and tested at the factory prior to shipment and will meet all requirements of the specifications under which it is furnished.

This product is designed, manufactured and distributed utilizing the ISO 9001:2000 Business Management System.
